Software Installation and Upgrade – C&G Unit Level 3

How do you currently update and install software on your ICT System?

Virtually all modern systems and devices rely on a combination of hardware and software in order to work. For these systems to perform at their best, the software needs to be installed correctly and configured to ensure the system performs well and meets the needs of users.

Have qualified staff to install and upgrade software ensuring faster performance of your computers, upgrading software to fix current bugs and stop the computer from experiencing faults. Get new features/functions which might be added to newer versions of software and improved security from added additional security features.

Remember – the longer a software package has been around and the more popular the software package is, the more the software represents a **security risk**. Over the useful life of a software package, security holes and the malicious viruses that take advantage of them make a long list of reasons to upgrade to newer and more secure versions of the same software.

Course Content

This course teaches participants how to install and/or upgrade various pieces of software from various locations and sources. Participants will also consider the importance of recording information associated with software installation and the importance of following organisational guidelines.

Duration & Assessment

- Assessment is via a portfolio of evidence
- Candidates will be required to attend **5** days of workshops

Cost £900.00 - Funding of 50% of costs available for eligible companies.
